

1. Define sales funnel and the different stages

Row	stage_1_views	stage_2_cart	stage_3_checkout	stage_4_payment	stage_5_purchase
1	4419	1371	977	792	730

- The number is shrinking as we go through the funnel

2. Conversion rates through the funnel

Row	stage_1_views	stage_2_cart	view_to_cart_rate	stage_3_checkout	cart_to_checkout...	stage_4_payment	checkout_to_pay...	stage_5_purchase	payment_to_purc...	overall_conversion...
1	4268	1332	31.0	951	71.0	768	81.0	708	92.0	17.0

- Payment_to_purchase (92%) – can be concluded that there is no issue in the payment session
- View_to_cart_rate (31%) – low because user just scroll through the app but did not adding anything to cart, maybe due to reason they can't find straight away the needed item, possible solution can be reviewing the interface or way of product placement to ease the search process by user, improve experience
- Overall_conversion_rate (17%) – something to highlight, not many users interested in checking out, can be because influence by the high price, possible solution maybe can add promotion or discount or vouchers

3. Funnel by source

Row	traffic_source	views	carts	purchases	cart_conversion_rate	purchase_conversion_rate	cart_to_purchase_conversion_rate
1	organic	1750	576	300	33.0	17.0	52.0
2	paid_ads	820	305	173	37.0	21.0	57.0
3	email	445	280	151	63.0	34.0	54.0
4	social	1253	171	84	14.0	7.0	49.0

- Highest purchase conversion rate is coming from email, can put attention to marketing through email to attract more users/buyers
- Vanity metric – if only view from social media views, because its purchase conversion rate is lowest'
- Traffic source from social is bringing 2nd high traffic (views) but it only total in 7% total purchase conversion rate (lowest), maybe can pull less attention from social media

4. Time to conversion analysis

Row	converted_users	avg_view_to_cart...	avg_cart_to_purc...	avg_total_journey...
1	708	11.19	13.36	24.55

- User who actually made payment take average of 13.36 minutes from cart to purchase, maybe can check is= there is any issue causing 13 minutes, maybe user take a long time to confirm its order before proceed payment, can be due to invisibility in the order details and wanted to do extra confirmation
- Average total journey is 24.55 minutes, quite normal, people want to browse through option and select the best for them, and maybe once item picked up, that don't really experience major problem to do payment.

5. Revenue funnel analysis

Row	total_visitors	total_buyers	total_revenue	total_orders	avg_order_value	revenue_per_buyer	revenue_per_visitor
1	4268	708	76037.93	708	107.4	107.4	17.82

- During the specified interval days, the total_buyers = total_orders. It means that every single customer placed exactly one order
- NEW term = Customer Acquisition Cost (CAC)
- If CAC = 50, average order value = 107, gross return = 107-50 = 57; can be concluded that marketing is highly efficient
- Revenue per visitor = 17.82, can infer that every visitor to the site, can make an average of 17.82. Means can afford to spend up to 17.82 on marketing to get a single visitor while still get profit
